

Howard Industries' Faux Marble Textures are created using enhanced photo-generated, high resolution printed images. These richly textural images are reproduced as long-lasting, high quality, solvent inkjet printed graphics using durable exterior sign-grade vinyl, our advanced opti-printing technology and a life-extending UV lamination. The images are applied directly to the primed surface of the DeSign Stone[®] sign creating a durable alternative to costly traditional masonry bases and columns.

Our opti-printing technology is the result of much research in the advancements of solvent inkjet printing graphics and includes expertise in selecting and using the highest quality materials and inks; printing using the latest technology at optimum environmental conditions with regard to printing climate, precise heating and drying times and temperatures; and expert application techniques for superior adherence to our DeSign Stone[®] surface.
